Rangefinder
suitable for the HAGA altimeter
It has to be measured as follows:

Example:

<table>
<thead>
<tr>
<th>Measuring tape</th>
<th>25 meters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scale of the altimeter</td>
<td>25</td>
</tr>
</tbody>
</table>

Now the distance has to be paced up or down until both plates coincide (see figure 2). From this point the measurement of the tree will be made.

The included measuring tape has to be adjusted to the desired distance. A viewing plate is fixed to the tape. The second plate can be buttoned to the distance of 15-20-25-30 meters which is marked on the tape. Then the tape has to be fastened by a nail or a drill to the tree which has to be measured (figure 1). For this purpose there is a hole in the fixed plate through which the drill can be ledged. The scale of the altimeter has to be adjusted in accordance with the measuring tape.
